OUTLINE This is a template for articles that mixes up the `classic-thesis` template by André Miede (Miede 2024). By no means it is better, it is just the one I find most comfortable with working. Basically, I have added the functionalities that I like and need. Feel free to use it, and let me know if you actually do.

1 ADDED FUNCTIONALITIES

Other than the many useful settings from the Classic Thesis template, I will outline here what I added.

1.I From the `theorem_environments.tex`

You have many objects of the Theorem environment type.

THANKS to the lettrine package, you can start sections in a cool way. Be ready to annotate equations:

The diagram shows the Schrödinger equation $i\hbar \frac{\partial}{\partial t} \Psi(x, t) = \hat{H} \Psi(x, t)$ with several annotations. A black arrow points from the text " $\hbar = \frac{h}{2\pi}$, reduced Planck constant" to the symbol \hbar . A red arrow points from the text "Hamilton operator" to the symbol \hat{H} . A blue arrow points from the text "Wave function" to the symbol $\Psi(x, t)$ on the right side of the equation. The terms $\Psi(x, t)$ on both sides of the equation are highlighted in light blue boxes.

- You can cross words
- highlight a **new term**
- set the metadata in hypersetup
- some cool colors green, red, blue, blue-violet
- you can also use them inside brackets like this
- ✓, ✗ are useful
- **TODO:** a todo generic tool
- **DONE** command
- you can use the indicator $\mathbb{1}$
- **HOT IDEA:** an idea
- $1/2$ appears nicely in text
- bold math installed, as well as rsfs for \mathcal{L}
- d is the differential operator

- if you have an equation:

$$E = mc^2 \quad (1.18) \quad \{\text{eqn:equa}$$

and another

$$a^2 + b^2 = c^2 \quad (1.19) \quad \{\text{eqn:equa}$$

you can reference them cleverly as eq. (1.18) and ?? . Equation (1.18) and ?? can be used at the beginning of a sentence.

This is to be compared in efficiency with mentioning Eq. 1.19 directly.

- equation labels are shown
- *(Left)*, *(Center)*, *(Right)*, *(Top)*, *(Bottom)*, *(a)*, *(b)*, *(c)*, *(d)* are useful for mentioning parts of an image.
- tikz is loaded
- algorithm, algpseudocode are loaded (see below)
- figref, Figref, twofigref, quadfigref, secref, Secref, twosecref, secrefs, eqref, Eqref, plaineqref, chapref, Chapref, rangechapref, algref, Algref, twoalgref, Twoalgref, partref, twopartref are useful for quick referencing.
- you can do a list of theorems **TODO: not adjusted**
- you can do a list of acronyms **TODO: not adjusted**
- you can do a nomenclature list **TODO: not adjusted**

Theorem 1.20 (Restatable Theorem). *We will repeat this just below.*

You can recall theorem 1.20 with the command of its name:

Theorem 1.20 (Restatable Theorem). *We will repeat this just below.*

You can create algorithms

Algorithm 1 An algorithm with caption

{alg:cap}

Require: $n \geq 0$

Ensure: $y = x^n$

$y \leftarrow 1$

$X \leftarrow x$

$N \leftarrow n$

while $N \neq 0$ **do**

if N is even **then**

$X \leftarrow X \times X$

$N \leftarrow \frac{N}{2}$

else if N is odd **then**

$y \leftarrow y \times X$

$N \leftarrow N - 1$

end if

end while
